In general terms the shape of an object data set or image can be de shy fined as the total of all information that is invariant under translations rotations and isotropic rescalings Thus two objects can be said to have the same shape if they are similar in the sense of Euclidean geometry For example all equilateral triangles have the same shape and so do all cubes In applications bodies rarely have exactly the same shape within measure shy ment error In suc From the Back Cover This book provides a comprehensive coverage of the statistical theory of shape The shape of a data set can be defined as the total of all information invariant under translations rotations and scale changes to the data Over the last decad
