This elegant book is sure to become the standard introduction to synthetic differential geometry. It deals with some classical spaces in differential geometry, namely prolongation spaces or neighborhoods of the diagonal. These spaces enable a natural description of some of the basic constructions in local differential geometry and in fact form an inviting gateway to differential geometry and also to some differential geometric notions that exist in algebraic geometry. The book would certainly make a good graduate textbook; it is clearly written and contains a reasonable number of nontrivial exercises.
