The action of a compact Lie group G on a compact sympletic manifold gives rise to some remarkable combinatorial invariants The simplest and most interesting of these is the moment polytopes a convex polyhedron which sits inside the dual of the Lie algebra of G One of the main goals of this monograph is to describe what kinds of geometric information are encoded in this polytope This book is addressed to researchers and can be used as a semester carefully written book on the so called Delzant spaces Many of the statements in the body of the book are left as exercises with copious hints At the end of each chapter there are very interesting bibliographical notes The reader who works throug
