By Paul C. Yang, Karsten Grove, Jon G. Wolfson, and edited by Alexandre Freire Sun-Yung A. Chang, Sun-Yung A. Chang, Paul C. Yang, Karsten Grove, Jon G. Wolfson, Alexandre Freire : Conformal, Riemannian and Lagrangian Geometry in mathematics and physics n dimensional anti de sitter space ads n is a maximally symmetric lorentzian manifold with constant negative scalar curvature the most fundamental quantity in differential geometry is arguably the riemann christoffel tensor \r\mu \nu \lambda\\beta\ which describes how spacetime is Conformal, Riemannian and Lagrangian Geometry:

Recent developments in topology and analysis have led to the creation of new lines of investigation in differential geometry The 2000 Barrett Lectures present the background context and main techniques of three such lines by means of surveys by leading researchers The first chapter by Alice Chang and Paul Yang introduces new classes of conformal geometric invariants and then applies powerful techniques in nonlinear differential equations to derive results on compac
