Differential Geometry offers a concise introduction to some basic notions of modern differential geometry and their applications to solid mechanics and physics Concepts such as manifolds groups fibre bundles and groupoids are first introduced within a purely topological framework They are shown to be relevant to the description of space time configuration spaces of mechanical systems symmetries in general microstructure and local and distant symmetries The book under review has grown out of lecture notes for a mini course given at a workshop on differential geometry and continuum mechanics at the International Centre for Mathematical Sciences in 2013 hellip addressing researchers and engineers in
