biomathematics 31 springer The Geometry of Population Genetics (Lecture Notes in Biomathematics):

The differential equations which model the action of selection and recombination are nonlinear equations which are impossible to solve explicitly. It is even difficult to describe in general the qualitative behavior of solutions. Recently Shahshahani began using differential geometry to study these equations. With this monograph I hope to show that his ideas illuminate many aspects of population genetics. Among these are his proof and clarification of Fisher's Fundamental Theorem of Natural Selection.
