Here is a systematic approach to such fundamental questions as What mathematical structures does Einstein Weyl causality impose on a point set that has no other previous structure defined on it The author proposes an axiomatization of the physics inspired notion of Einstein Weyl causality and investigating the consequences in terms of possible topological spaces One significant result is that the notion of causality can effectively be extended to discontinuum From the reviews The casual structure of space times can be described by means of two notions of precedence namely chronological and casual precedence one can then abstract these two notions and the relationship between them and consider casual space
