By Türker Biyikoglu, Josef Leydold, Peter F. Stadler : Laplacian Eigenvectors of Graphs: Perron-Frobenius and Faber-Krahn Type Theorems (Lecture Notes in Mathematics) Laplacian Eigenvectors of Graphs: Perron-Frobenius and Faber-Krahn Type Theorems (Lecture Notes in Mathematics):

0 of 1 review helpful Wonderful entry into graph theory By A techno geek It is a great pleasure to find 21st century mathematics results that 1 I can understand 2 are published in a reasonably priced book no publisher should charge more than 0 33 a page and 3 possibly useful This book is very clearly written with detailed proofs and scrupulous scholarship This fascinating volume investigates the structure of eigenvectors and looks at the number of their sign graphs nodal domains Perron components and graphs with extremal properties with respect to eigenvectors The Rayleigh quotient and rearrangement of graphs form the main methodology Eigenvectors of graph Laplacians may seem a surprising topic for a book but the authors show that there are subtle differences between the properties of solutions of Schr ouml di From the reviews This is an interesting hellip book about a very specialized topic in spectral graph theory namely the eigenvectors of the generalized Laplacian matrices of graphs hellip Overall I found the book well worth reading with a clear a
