By L V Ovsyannikov : Lectures on the Theory of Group Properties of Differential Equations maxwells equations are a set of partial differential equations that together with the lorentz force law form the foundation of classical electromagnetism quantum college of arts and sciences mathematics detailed course offerings time schedule

are available for summer quarter 2017; autumn quarter 2017; Lectures on the Theory of Group Properties of Differential Equations:

These lectures provide a clear introduction to Lie group methods for determining and using symmetries of differential equations a variety of their applications in gas dynamics and other nonlinear models as well as the author's remarkable contribution to this classical subject. It contains material that is useful for students and teachers but cannot be found in modern texts. For example, the theory of partially invariant solutions developed by Ovsyannikov provides a powerful tool. From the Inside Flap: These lectures provide a clear introduction to Lie group methods for determining and using symmetries of differential equations a variety of their applications in gas dynamics and other nonlinear models as well as the author's remarkable contribution.
